

Figure 6: Light curves of the Cepheids stars in the  $F475W$  (black) and  $F814W$  (grey) bands, phased with the period in days given in the lower-right corner of each panel. The open symbols show the bad data points, i.e. with errors larger than  $3\sigma$  above the mean error of a given star, which were not used in the calculation of the period and mean magnitudes. For a few very bright Cepheids, the light curves have been shifted downward by 1 or 2 mag, as shown by an arrow in the top-left corner of a panel.
